

Sea bass (*Dicentrarchus labrax*) in divisions 4.b–c, 7.a, and 7.d–h (central and southern North Sea, Irish Sea, English Channel, Bristol Channel, and Celtic Sea)

ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied, total removals[†] in 2023 should be no more than 2542 tonnes.

ICES notes the existence of a precautionary management plan, developed and adopted by one of the relevant management authorities for this stock.

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and spawning-stock size is below MSY $B_{trigger}$ and between B_{pa} and B_{lim} .

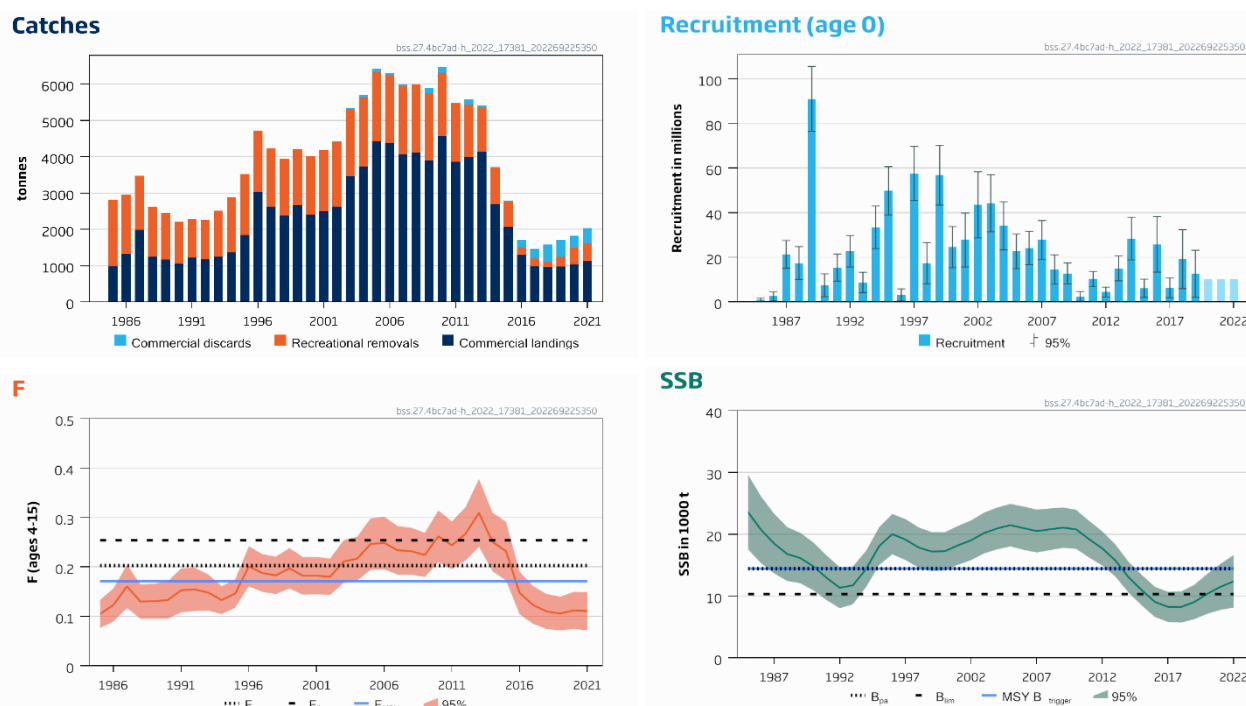

Figure 1 Sea bass in divisions 4.b–c, 7.a, and 7.d–h. Summary of the stock assessment. Recreational removals are model estimates based on a survey in 2012 and implemented management measures. Discard estimates are available since 2002. Fishing mortality (F) is shown for the combined commercial and recreational fisheries. The assumed recruitment values for 2020–2022 are shaded in a lighter colour.

[†]Total removals include both commercial and recreational catches, taking mortality of released fish into account (estimated at approximately 5%).

Catch scenarios

Table 1 Sea bass in divisions 4.b–c, 7.a, and 7.d–h. Assumptions made for the interim year and in the forecast.

Variable	Value	Notes
$F_{\text{ages 4–15}} (2022)$	0.113	Total F , $F_{\text{sq}} = F_{\text{average}} (2019–2021)$ (0.081) for commercial fishery, plus $F_{\text{rec}} = 0.031^*$, assuming full compliance of recreational fisheries in 2022
SSB (2023)	12899	Short-term forecast; in tonnes
$R_{\text{age 0}} (2020–2023)$	10105	Geometric mean (2010–2019); in thousands
Total removals (2022)	1870	Short-term forecast fishing at $F = 0.113$; in tonnes
Total landings (2022)	1211**	Short-term forecast; in tonnes
Discards (2022)	148**	Short-term forecast; in tonnes
Recreational removals (2022)	511	Short-term forecast assuming an $F = 0.031$; in tonnes

* Recreational F as estimated in 2012 (0.068, reduced [by 54%]) to account for management measures since 2012.

** The split of total commercial F into commercial landings and commercial discards in the interim year is estimated by the model.

Table 2 Sea bass in divisions 4.b–c, 7.a, and 7.d–h. Annual catch scenarios for 2023. All weights are in tonnes.

$\text{SSB}_{2024} = \text{SSB}_{2023}$	2213	0.132	12899	0.00	–0.135

* Includes commercial catch and recreational removals (taking mortality of released fish into account, estimated at approximately 5%).

** SSB 2024 relative to SSB 2023.

*** Advice value for 2023 relative to the MSY value for 2022 (2216 tonnes).

[^] MAP multiannual plan (EU, 2019).

The increase in advice for 2023 is due to an increase in stock size, with the larger spawning-stock biomass also allowing a higher target fishing mortality.

Basis of the advice

Table 3 Sea bass in divisions 4.b–c, 7.a, and 7.d–h. The basis of the advice.

Advice basis	MSY approach
Management plan	ICES is aware of the multiannual management plan (MAP) which has been adopted by the EU for this stock (EU, 2019) and which ICES considers to be precautionary. There is no agreed shared management plan with UK for this stock, and ICES provides advice according to ICES MSY approach. Catch scenarios consistent with the MAP F_{MSY} ranges are provided.

Quality of the assessment

Limited sampling of the discards and recreational removals, leads to uncertainty in catch data and increases the uncertainty in the assessment. The discard values are estimated from sampling programmes and more recently from a combination of sampling programmes and logbooks, where sampling is variable across fleets and years. Estimates of discards are available only from the early 2000s, but do not cover all fisheries, are imprecise, and are only included for some fleets in the assessment. For the forecast, the discard ratio assumed is the estimate provided by the assessment model. However, this assumed rate is much lower than the recently observed discards.

The estimate of 1440 tonnes of recreational removals (including post-release mortality, estimated 5%) in 2012 is based on multiple surveys covering a range of years. As in previous years, the mortality rate from recreational removals for 1985–2014 (excluding 2012) was assumed to be the same as estimated for 2012. In the assessment, the mortality rate from recreational removals for 2015–2021 was derived by scaling down the F from 2012 to account for the management measures in these years, assuming full compliance.

Fishery sampling rates have been variable over time for all countries. Additional information on recreational removals from all countries is needed in order to improve these estimates and the stock assessment model.

Stock identity is still under investigation.

Figure 2 Sea bass in divisions 4.b–c, 7.a, and 7.d–h. Historical assessment results (final-year SSB estimates and final three years of recruitment assumptions are included).

Issues relevant to the advice

Following the prohibition of the directed sea bass fishery in 2015, discarding has increased. Sea bass is still being caught as bycatch.

ICES notes that under the ICES MSY approach scenario, the SSB in 2024 is expected decrease slightly, remaining below MSY $B_{trigger}$.

ICES does not provide any split in the catch scenarios table this year as the recreational fishing pressure cannot be allocated in the absence of known management measures in 2023 (e.g. bag limit) and the limited data on recreational removals.

Reference points
