

Blue whiting (*Micromesistius poutassou*) in subareas 1–9, 12, and 14 (Northeast Atlantic and adjacent waters)

ICES advice on fishing opportunities[†]

Please note: the present advice replaces the advice given in September 2022.

ICES advises that when the long-term management strategy agreed by the European Union, the Faroe Islands, Iceland, and Norway is applied, catches in 2023 should be no more than 1 359 629 tonnes.

Stock development over time

Fishing pressure on the stock is above F_{MSY} and F_{pa} but below F_{lim} ; spawning-stock size is above $MSY B_{trigger}$, B_{pa} , and B_{lim} .

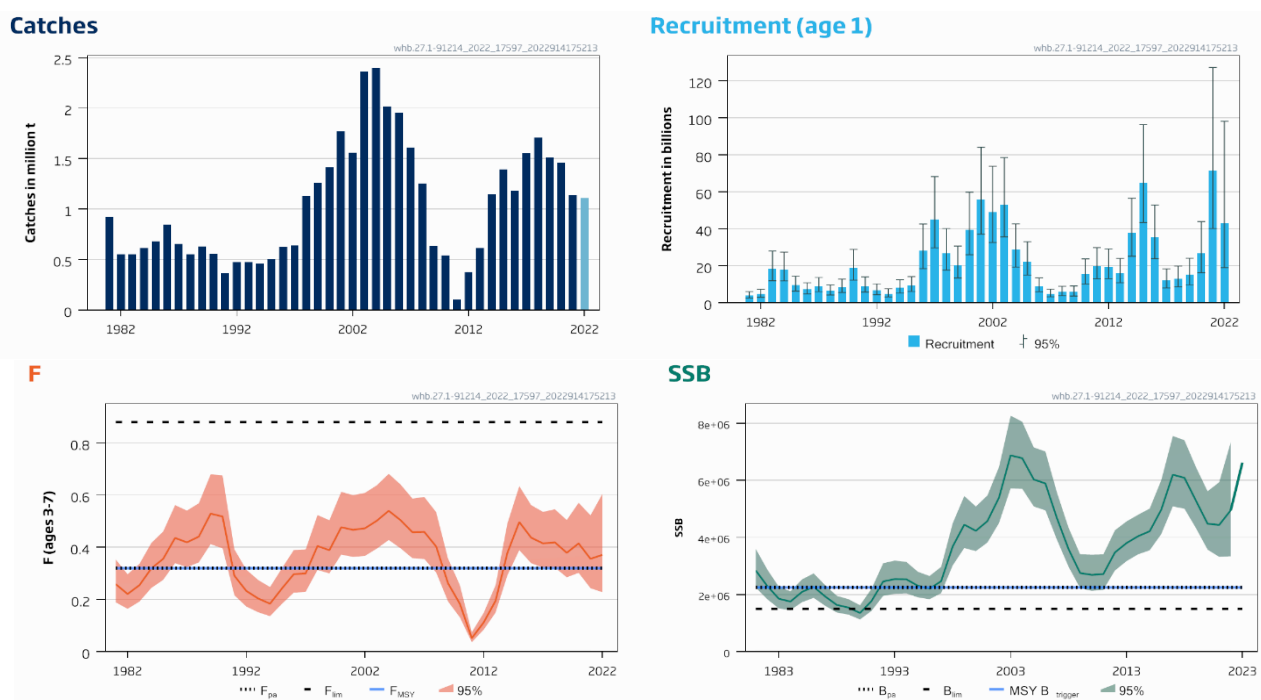

Figure 1 Blue whiting in subareas 1–9, 12, and 14. Summary of the stock assessment. The catch estimate for 2022 is preliminary. The assumed recruitment value for 2023 is shaded in a lighter colour.

Catch scenarios

Table 1 Blue whiting in subareas 1–9, 12, and 14. Values in the forecast and for the interim year.

Variable	Value	Notes
$F_{ages\ 3-7}$ (2022)	0.37	From the assessment (based on assumed 2022 catches)
SSB (2023)	6 621 207	From the assessment; in tonnes
$R_{age\ 1}$ (2022)	43 220 294	From the assessment; in thousands
$R_{age\ 1}$ (2023–2024)	22 537 250	Geometric mean (1996–2021); in thousands
Total catch (2022)	1 107 529	As estimated by ICES, based on declared national quotas and expected uptake; in tonnes

[†] Basis for the advice has changed. Text and tables throughout the advice sheet have been updated to reflect this.

Table 2 Blue whiting in subareas 1–9, 12, and 14. Annual catch scenarios. All weights are in tonnes.

* SSB 2024 relative to SSB 2023.

** Catch 2023 relative to expected catch in 2022 (1 107 529 tonnes).

*** Catch 2023 relative to advice for 2022 (752 736 tonnes).

\wedge SSB_{2024} and Catch_{2023} values are the closest available approximation to either B_{lim} , B_{pa} and B_{trigger} or target catches.

The advice for 2023 is 81 % higher than that for 2022 because of a large upward revision of estimated recruitment in 2021 (age 1).

Basis of the advice

Table 3 Blue whiting in subareas 1–9, 12, and 14. The basis of the advice.

Advice basis	Long-term management strategy
Management plan	A long-term management strategy was agreed by the European Union, the Faroe Islands, Iceland, and Norway (Anon., 2016) and subsequently by UK in 2021 (Anon., 2021). ICES has evaluated the strategy, including clause 6.b, and found it to be precautionary (ICES, 2016a, 2017).

Quality of the assessment

This year's assessment shows a substantial revision of the historical values of F, SSB and recruitment for 2021. The 2020 year class (recruitment at age 1 in 2021) is now estimated to be at a historical high (71.6 billion), while last year's estimate was 22.8 billion. Fishing mortality (F) in 2021 is revised downward by 29%, and SSB in 2021 upward by 46%. The revision of the 2020 year class is due to a historically high survey index value in 2022 and is corroborated by high commercial catch-at-age of the same year class in 2021 and 2022. The catch for 2021 was 9.1% lower than the preliminary value used last year, which contributes to the revision of F and SSB in this year's assessment.

Other surveys, which are not presently used in the assessment, confirm a very large 2020 year class.

Preliminary catch data from Russian Federation for 2021 were used in the assessment, together with Russian catch samples that were available for the first half year. Historically, preliminary catches are comparable to ICES final estimated catch. Russian data on age composition of the catch in 2022 are not available. ICES used the historical (2019–2021) Russian proportion (13%) of total international catch weight to estimate the total catches for 2022. It was assumed that the age distribution of Russian catches is similar to the catch-at-age distribution available from other nations.

Figure 2 Blue whiting in subareas 1–9, 12, and 14. Historical assessment results.

Issues relevant for the advice

In the application of the long term management strategy, the 25% restriction in the increase of catch advice is not applied this year because clause 6.b states that a constraint on annual TAC variation shall not be applied when the catch advice deviates more than 40% from the catch advice of the preceding year. This clause was evaluated by ICES and found precautionary in 2017 (ICES, 2017).

There have been consistent deviations from the long-term management strategy since 2018 as evident from the sum of unilateral quotas. During the evaluation of the management strategy (ICES, 2016a), the implementation error in the form of a consistent overshoot of the TAC was not included. Therefore, failing to adhere to the advised catches as derived from the application of the MSY approach or the long-term management strategy may not be precautionary. Specifically, this may result in an increased risk for the stock to fall below B_{lim} , loss of catch in the long term and unsustainable utilization of the resource.

The 2020 year class is estimated to be historically high and will be fully recruited to the fishery in 2023.

F has exceeded F_{pa} since 2014. This does not adhere to the precautionary approach and in the long term could result in increased risk of SSB to fall below B_{lim} and loss of yields.

Reference points

Table 4 Blue whiting in subareas 1–9, 12, and 14. Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	2250000 t	B_{pa}	ICES (2013a, 2013b, 2016a)
	F_{MSY}	0.32	Stochastic simulations with segmented regression stock–recruitment relationship capped to F_{P05}	ICES (2016a)
Precautionary approach	B_{lim}	1500000 t	Approximately B_{loss}	ICES (2013a, 2013b, 2016a)
	B_{pa}	2250000 t	$B_{lim} \exp(1.645 \times \sigma)$, with $\sigma = 0.246$	ICES (2013a, 2013b, 2016a)
	F_{lim}	0.88	Equilibrium scenarios with stochastic recruitment: F value corresponding to 50% probability of ($SSB < B_{lim}$)	ICES (2016a)
	F_{pa}	0.32	F_{P05} ; the F that leads to $SSB \geq B_{lim}$ with 95% probability	ICES(2016a, 2021a)
EU–Faroes–Iceland–Norway long-term management strategy	SSB_{mgt_lower}	1500000 t	B_{lim}	Anon (2016)
	SSB_{mgt}	2250000 t	B_{pa}	
	F_{mgt_lower}	0.05	Arbitrary low F	
	F_{mgt}	0.32	F_{MSY}	

Basis of the assessment

Table 5 Blue whiting in subareas 1–9, 12, and 14. Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2022a)
Assessment type	Age-based analytical assessment (SAM; ICES, 2021a) that uses catches in the model and the forecast
Input data	Commercial catches, preliminary estimate of catch-at-age in the year (Q1–Q2) in which the assessment is carried out. One survey index (International Blue Whiting Spawning Stock Survey [IBWSS; A1142] ages 1–8, 2004–2022, excluding 2010 and 2020). Time invariant maturity at age was estimated in 1994 by combining maturity ogives from the southern and northern areas. Time invariant natural mortality fixed at 0.2 for all ages, derived in the 1980s from age compositions before the targeted fishery started.
Discards and bycatch	Discard data since 2014 have been included in the assessment
Indicators	Estimates of recruitment from surveys: Joint Norwegian-Russian survey Barents Sea (G5348), International Ecosystem Survey in the Nordic Seas in May (A3675, [IESNS]), the Faroese bottom-trawl surveys (G1264 [FO-GFS-Q1], G3284 [FO-GFS-Q3]) and the Icelandic bottom-trawl survey in spring (G3239 [IS-SMB]).
Other information	The stock was benchmarked in 2012 (WKPELA; ICES, 2012). An interbenchmark protocol was conducted in the spring of 2016 (ICES, 2016b).
Working group	Working Group on Widely Distributed Stocks (WGWIDE ; ICES 2022b)

* Official catches by area from Sweden are not included (2012).

** Official catches by area from Sweden and Greenland are not included (2013).

*** The total includes only 1336 tonnes from UK (England + Wales; 2016 total catch from UK [England + Wales] = 1374 tonnes).

Table 10 Blue whiting in subareas 1–9, 12, and 14. Landings inside and outside the NEAFC Regulatory Area (RA), as estimated by ICES, as well as total landings. Weights are in tonnes.

Year	Inside the NEAFC RA	Outside the NEAFC RA	Total catches	Percentage inside the NEAFC RA

2023		22537250**			6621207^					

* Catches presented are the sum of product (SOP) values from catch- and weight-at-age used in the assessment model.

** Geometric mean (1996–2021).

*** Preliminary catches.

^ SSB calculated from the assessment and assumed recruitment for 2023.
