

## Cod (*Gadus morhua*) in subareas 1 and 2 (Northeast Arctic)

### ICES advice on fishing opportunities

ICES advises that when the Joint Norwegian–Russian Fisheries Commission (JRNFC) management plan is applied, catches in 2022 should be no more than 708 480 tonnes.

### Stock development over time

Fishing pressure on the stock is at  $F_{MSY}$  between  $F_{pa}$  and  $F_{lim}$  and spawning-stock size is above  $MSY B_{trigger}$ ,  $B_{pa}$ , and  $B_{lim}$ .

**Figure 1<sup>†</sup>** Cod in subareas 1 and 2 (Northeast Arctic). Catch, recruitment,  $F$ , and SSB. For this stock,  $F_{MSY}$  and  $F_{MGT}$  ranges from 0.40 to 0.60, and there are three  $SSB_{MGT}$  values (460 000, 920 000 and 1 380 000 tonnes) which are not shown.

### Catch scenarios

**Table 1<sup>‡</sup>** Cod in subareas 1 and 2 (Northeast Arctic). Values in the forecast and for the interim year.

Variable	Value	Notes
$F_{ages\ 5-10}$ (2021)	0.65	Based on a catch of 885 600 t for 2021.
SSB (2022)	696 371	From assessment; tonnes
$R_{age\ 3}$ (2021)	557 000	From recruitment model; thousands
$R_{age\ 3}$ (2022)	620 000	From recruitment model; thousands
$R_{age\ 3}$ (2023)	547 000	From recruitment model; thousands
Total catch (2021)	885 600	TAC; tonnes

<sup>†</sup> Version 2: Figure changed. The assessment was revised due to discovery of errors in the calculation of some of the survey indices for 2021 used in the assessment (Joint Norwegian-Russian survey Barents Sea, Feb–Mar (G5348) bottom trawl (BTr) and acoustic (Aco) indices).

<sup>‡</sup> Version 2: Values changed.

**Table 2<sup>§</sup>** Cod in subareas 1 and 2 (Northeast Arctic). Annual catch scenarios. All weights are in tonnes.

Basis	Total catch (2022)	Ftotal (2022)	SSB (2023)	% SSB change *	% TAC change **	% Advice change **
ICES advice basis						
Management plan <sup>^</sup>	708 480	0.62	578 966	-17	-20	-20
Other scenarios						
MSY approach: $F_{MSY}$	504 244	0.40	720 844	4	-43	-43
$F = 0$	0	0	1 103 288	58	-100	-100
$F = F_{2020}$	735 105	0.65	561 135	-19	-17	-17
$F_{pa}$	504 244	0.40	720 844	4	-43	-43
$F_{lim}$	810 202	0.74	511 742	-27	-9	-9

\* SSB 2023 relative to SSB 2022.

\*\* Advice value for 2022 relative to TAC and advice value for 2021 (885 600 tonnes).

<sup>^</sup> Since SSB in 2022 is between  $B_{pa} = 460\,000$  tonnes and  $2 \times B_{pa} = 920\,000$  tonnes,  $F = 0.40$  is used in the 3-year prediction, giving catches of 504 244, 528 049 and 557 768 tonnes in 2022, 2023, and 2024, respectively. The average of this is 530 020 tonnes. According to the harvest control rule (HCR), the maximum decrease in TAC is limited by 20%, giving a catch of 708 480 tonnes, which corresponds to an  $F$  of 0.62 in 2022.

The advice for 2022 is 20% lower than the advice for 2021 due to a declining stock trend and the application of the 20% TAC change constraint.

## Basis of the advice

**Table 3** Cod in subareas 1 and 2 (Northeast Arctic). The basis of the advice.

Advice basis	Joint Russian–Norwegian Fisheries Commission management plan
Management plan	<p>At the 46th meeting of the Joint Russian–Norwegian Fisheries Commission (JRNFC) in October 2016, the previously used management plan was amended, and the current plan is as follows:</p> <p>The TAC is calculated as the average catch predicted for the coming three years, using the target level of exploitation (<math>F_{tr}</math>).</p> <p>The target level of exploitation is calculated according to the spawning-stock biomass (SSB) in the first year of the forecast as follows:</p> <ul style="list-style-type: none"> <li>- if <math>SSB &lt; B_{pa}</math>, then <math>F_{tr} = SSB/B_{pa} \times F_{MSY}</math>;</li> <li>- if <math>B_{pa} \leq SSB \leq 2 \times B_{pa}</math>, then <math>F_{tr} = F_{MSY}</math>;</li> <li>- if <math>2 \times B_{pa} &lt; SSB &lt; 3 \times B_{pa}</math>, then <math>F_{tr} = F_{MSY} \times (1 + 0.5 \times (SSB - 2 \times B_{pa})/B_{pa})</math>;</li> <li>- if <math>SSB \geq 3 \times B_{pa}</math>, then <math>F_{tr} = 1.5 \times F_{MSY}</math>;</li> </ul> <p>where <math>F_{MSY} = 0.40</math> and <math>B_{pa} = 460\,000</math> tonnes.</p> <p>If the SSB in the present year, the previous year, and each of the three years of prediction is above <math>B_{pa}</math>, the TAC should not be changed by more than <math>\pm 20\%</math> compared with the previous year's TAC. In this case, however, <math>F_{tr}</math> should not be below 0.30.</p> <p>In 2014, JRNFC decided that from 2015 onwards, Norway and Russia can transfer to or borrow from the following year up to 10% of their country's quota.</p> <p>ICES evaluated this harvest control rule in 2016 (ICES, 2016a) and 2021 (ICES, 2021a) and concluded that it is precautionary.</p>

## Quality of the assessment

Input data and assessment model settings were changed at the benchmark (ICES, 2021a), and this resulted in a downward revision of SSB.

<sup>§</sup> Version 2: Values for 'Other scenarios' changed.

All surveys, in particular the ecosystem survey, indicate a decrease in abundance from 2020 to 2021 that is larger than expected and therefore the assessment is more uncertain than usual.

**Figure 2\*\*** Cod in subareas 1 and 2 (Northeast Arctic). Historical assessment results. There was a benchmark revision in 2021.

### Issues relevant for the advice

Fisheries targeting Northeast Arctic (NEA) cod take as bycatch a considerable part of the total golden redfish (*Sebastes norvegicus*) catch, and this bycatch is still above any sustainable catch level. Measures to minimize bycatch levels are essential.

Bycatch of coastal cod should be kept as low as possible in order to promote rebuilding of the coastal cod (*Gadus morhua*) stock.

The advice this year is considerably lower than last year. The stock abundance is revised downwards due to both a downward revision following the benchmark (ICES, 2021a) and to unexpectedly low survey indices.

The advice for 2022 is robust to the intermediate year catch assumption due to the 20% constraint on annual TAC change.

### Reference points

**Table 4** Cod in subareas 1 and 2 (Northeast Arctic). Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	460 000 t	$B_{pa}$ and trigger point in HCR	ICES (2003, 2021a)
	$F_{MSY}$	0.40–0.60	Long-term simulations	ICES (2003, 2021a)
Precautionary approach	$B_{lim}$	220 000 t	Change point regression	ICES (2003, 2021a)
	$B_{pa}$	460 000 t	The lowest SSB estimate having > 90% probability of remaining above $B_{lim}$	ICES (2003, 2021a)
	$F_{lim}$	0.74	F corresponding to an equilibrium stock = $B_{lim}$	ICES (2003, 2021a)
	$F_{pa}$	0.40	The highest F estimate having > 90% probability of remaining below $F_{lim}$	ICES (2003, 2021a)
Management plan	$SSB_{mgt}$	460 000 t	Two-step (double hockey stick) HCR, see Table 3	ICES (2017)
	$F_{mgt}$	0.40–0.60	Two-step (double hockey stick) HCR, see Table 3	ICES (2017)

\*\* Version 2: Figure changed.

## Basis of the assessment

**Table 5** Cod in subareas 1 and 2 (Northeast Arctic). Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2021b).
Assessment type	Age-based analytical assessment (SAM; ICES, 2021c) that uses catches in the model and in the forecast
Input data	Commercial catches (international landings, ages and length frequencies from catch sampling); four survey indices (Joint Norwegian-Russian survey Barents Sea, Feb–Mar (G5348) bottom trawl (BTr) and acoustic (Aco) indices; Russian bottom trawl survey, Oct–Dec (G5348); Joint Norwegian-Russian Ecosystem survey (A5216; Btr)); annual maturity data from the four surveys; natural mortalities from annual stomach sampling.
Discards and bycatch	Discarding is considered negligible in recent years (below 5%). Bycatch is included.
Indicators	None.
Other information	Last benchmarked in February 2021 (ICES, 2021a).
Working group	Arctic Fisheries Working Group (AFWG).

## History of the advice, catch, and management

**Table 6** Cod in subareas 1 and 2 (Northeast Arctic). ICES advice, agreed TACs, the official and unreported landings, and ICES catches. All weights are in tonnes.
